I love the skin smoothing tool, which is great on photos, but I am worried that the same effect may not work on a video where the shutter speed may vary—or worse, where the scene might be changing along with the camera. In the end, I will be the last to line Photoshop up at the altar of Adobe. You may as well judge me ahead of time, because I will end up where I started out. That said, I wouldn't mind if they added a more stable setting for the Zone Replacer tool in the new version of Photoshop. Meanwhile, in the world of business, I keep hearing rumours that the customer service contract with Adobe is up for renewal and they are looking to recoup the money that they lost with Lightroom. Is it better not to mention this at all? Personally, I have been using Lightroom for over a year now. I am annoyed that in a software update, Photoshop keeps changing features that I have not tried. I can understand what's happening, since the updates involve massive amounts of changes to a complex piece of software. However, in saying that, this version of Photoshop should have taken more time for development. The collaboration features would have been a great help, and the new version should have stayed out there for a couple of months. We have one month to go before the release of the new version of Photoshop. In other words, it seems that its development has not been expedited. On the other hand, considering how long Lightroom took to introduce Photoshop features, we are not that far behind. The free semester of Lightroom has already expired, so we are seeing the results of two years of investment. I have stacks of books on my desk waiting for the Lightroom version we may get at the end of the year or next. Imagine if I had to do this same thing manually two or three times a year, or that I had to wait until January to start importing images from the latest batch of holidays.

As mentioned earlier, layers in Photoshop represent the photo on the screen. Each layer can be active or inactive to toggle its visibility or visibility of the image you see on the canvas. To add a layer to your canvas, click once on the layer thumbnail at the top of the screen and drag the cursor to the lower-right corner of the canvas. Once the layer thumbnail is on the canvas, you can arrange it anywhere on the canvas by clicking and dragging it. You can add layers to group the layers and create as many layers as required. When you add the layer, it creates a new layer above all the previous layers. So, the final output will contain all the layers below the newly added layer. It's a good idea to create the layers with a hierarchy as it will help in organizing the layers. You can use AI-driven tools like Puppet Warp to simulate the perspective of a 3D design. As you drag in a new document, Photoshop will create a new layer for you and automate the process of painting in perspective.

Even more, you can use AI technology to analyze every aspect of your image to find the right corrections for each, from exposure, contrast and black and white.

You can access this magic in the built-in **AI workspace**! We'll then teach you how to work with Photoshop's powerful adjustment tools, including Levels, Curves, and Vibrance, as well as how to make your images look more colorful by using the Hue/Saturation tool to adjust the colors of your image. And after that, you'll learn how to enhance your images with a range of creative filters, including the Swing filter, Saturation filter, Ray-trace filter, and Dissolve filter.
